Abstract

This package contains dvips configuration files that can be used with duplex printers to enable or disable various forms of two-sided printing. To print a one-sided document on a duplex printer, use the switch “-Penkelsidigt” to dvips. To print a two-sided document on a duplex printer, use the switch “-Pdubbelsidigt” to dvips. This gives correct results for normal documents in portrait orientation. For two-sided documents in landscape orientation, the switch “-Pdubbelroterat” may be better, depending on your preferences.
